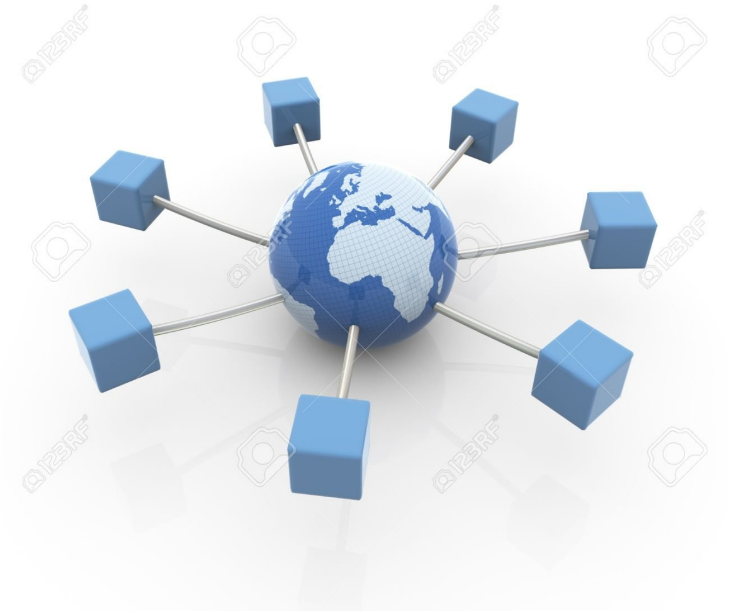
Elsevier adds ClinicalKey to its global resources

25 May 2017 | News

The expansion of the Research4Life access program with ClinicalKey benefits healthcare professionals in under-resourced, low- and middle-income communities around the globe.



Elsevier, the information analytics company specializing in science and health, will add ClinicalKey to its global research and health resources available through Research4Life starting in June 2017. The expansion of the Research4Life access program with ClinicalKey benefits healthcare professionals in under-resourced, low- and middle-income communities around the globe.

ClinicalKey is Elsevier's premier clinical search engine, providing access to the most current scientific and medical information, and it will help Research4Life meet the 2012 World Health Organization (WHO) declaration that health policies and practices globally should be informed by the best research evidence.

As a founding partner of Research4Life, Elsevier contributes more than a quarter of the 77,000 peer-reviewed journals, books and scholarly databases that are available through the program. Access to ClinicalKey adds to an existing collection of research resources offered by Elsevier, including ScienceDirect and Scopus. Elsevier also provides technical, strategic and communications expertise to help advance and promote Research4Life.
