

Oracle Health Sciences Reimagines Clinical Development Technology

06 February 2018 | News

Oracle also announced Clinical One Randomization and Supplies Management

Oracle announced the launch of Oracle Health Sciences Clinical One Platform, a cloud-based eClinical environment that is intended to redefine the way technology supports clinical research, during a roadshow in Mumbai.

Oracle also announced Clinical One Randomization and Supplies Management.

Developing a potentially life-saving drug from a promising molecule to an FDA-approved therapy can take more than a decade and cost billions of dollars due to redundant processes, increasing volumes and variety of patient data, and older technology systems that don't communicate with one another. Oracle Health Sciences is tackling these issues with its Clinical One Platform, a new cloud-based eClinical solution that will unify clinical development operations and information in a single environment with shared functions and an easy-to-use interface for sites, clinical coordinators and their counterparts.

Unlike other products in the market, which are point solutions that address only a single part of the drug development lifecycle or a single area within clinical research, Clinical One Platform is a holistic, unified cloud environment. It is being built from the ground-up to address the needs of the entire drug development lifecycle – everyone and every process required to get a drug to market.

The vision for its Clinical One Platform is to bring more drugs to market faster and offer hope for more cures by eliminating redundancies, creating process efficiencies and sharing information—in a way that has never been done before.

In addition to unveiling its Clinical One Platform, Oracle also launched its first capability in the new environment, Clinical One Randomization and Supplies Management.

Designed with self-service in mind and to eliminate the need for customization, this capability will feature an intuitive user interface, enabling clinical teams to design, validate and deploy a study in days with the click of a button. This enables clinical coordinators to quickly add patients to a trial, collect screening information and ensure eligibility for randomization in record time.

Jim Streeter, Global Vice President Life Sciences Product Strategy, Oracle said, “The pharmaceutical industry has been facing challenges in bringing new drugs to the market in a timely manner, while maintaining quality and safety. Clinical

operations rely on a collection of point solutions that are residing in silos and creating redundancy in the process. The Oracle Health Sciences Clinical One platform is the only cloud environment built from the ground-up to support the core capabilities required for effective study management throughout the entire clinical development lifecycle – from design and planning, to start-up and conduct, to close-out and post-marketing.”

“The aim of launching the Clinic One platform is to enable organisations to accelerate the entire drug development process by eliminating redundancies and creating process efficiencies, while maintaining safety and compliance”, he added.
