

Novartis to develop novel anti-infective drug candidates

04 October 2018 | News

Research and development for new medicines to treat tropical diseases continues through the Novartis Institute for Tropical Diseases.

Novartis has entered into a licensing and equity agreement with Boston Pharmaceuticals for the development of three novel anti-infective drug candidates that are part of the Novartis Infectious Diseases portfolio, which have the potential to address the need for new agents to treat antibiotic resistant Gram-negative infections.

Under the terms of the agreement, Boston Pharmaceuticals acquired worldwide rights to two complementary candidates targeting carbapenem-resistant enterobacteriaceae (CRE) and one candidate targeting *Pseudomonas* infections. Novartis will receive an upfront payment and is entitled to royalties and milestone payments for successfully commercialized medicines. In addition, Novartis will receive an equity stake in two new companies formed together with Boston Pharmaceuticals to further develop and commercialize these programs. Financial terms of the agreement were not disclosed.

The programs in this agreement include:

- LYS228 is a potential best-in-class monobactam which has entered clinical development and which has demonstrated activity against CRE with resistance caused by serine beta-lactamases (SBLs) and/or metallo beta-lactamases (MBLs);
- IID572 is a novel beta-lactamase inhibitor that may be used in combination with LYS228 or other beta-lactam antibiotics to expand their use against difficult-to-treat infections caused by a broader spectrum of CRE; and
- MAK181 is an oral, first-in-class LpxC inhibitor for *Pseudomonas* infections.
