Omron Healthcare to launch blood pressure monitor with EKG capability

15 April 2019 | News

EKG is an essential measurement for those with atrial fibrillation, also known as arrythmia or Afib, a condition causing irregular heartbeat that can lead to heart health-related complications, including increased risk of stroke and heart failure

Omron Healthcare, Inc., the global leader in personal heart health and wellness technology, has secured FDA clearance on its new Complete™, the first blood pressure monitor with EKG capability in a single device, and will open pre-orders on April 15th at 12:00 pm EST in the U.S. on OmronHealthcare.com.

Omron developed Complete in partnership with AliveCor, the market leader in FDA-cleared personal EKG technology. Complete uses the advanced new algorithm designed by AliveCor for improved detection of the possibility of Afib along with trusted medical-grade blood pressure measurement from Omron.

Complete is an upper arm blood pressure monitor that allows users to simultaneously monitor EKG and blood pressure readings at home. EKG readings can be measured by touching electrodes conveniently located on the top face and both sides of the monitor for easy access and comfort.

EKG is an essential measurement for those with atrial fibrillation, also known as arrythmia or Afib, a condition causing irregular heartbeat that can lead to heart health-related complications, including increased risk of stroke and heart failure.

Complete is the recent recipient of the iF Design Award 2019, presented by iF International Forum Design GmbH, one of the world's most prestigious design awards. This award was presented to Complete for its uniqueness, innovation, aesthetic appearance and performance.
