Indian Immunologicals Ltd

### Expansion mode

Having firmly established in the animal vaccine space, Indian Immunologicals is strengthening its position in the human health

The last fiscal year saw Indian Immunologicals (IIL) achieve revenues of over ₹282.23 crore from animal and human vaccines and therapeutics. IIL achieved a major milestone when Raksha-Ovac, its flagship brand crossed the ₹100 crore sales mark. It's the first brand from India in the animal health care sector to achieve this feat. Currently, IIL has the capacity to produce 250 million doses of Raksha Ovac, a Foot and Mouth disease (FMD) vaccine for cattle, making it the third largest facility in the world for FMD vaccines.

Abhayrab, IIL's indigenously developed brand of rabies vaccine, hit the ₹90 crore mark this year, leading to the overall growth of the company. IIL was the second company in the world to launch a purified Vero cell rabies vaccine.

The Brucellosis vaccine for the disease that affects cattle, buffalo, pigs, and other animals brought in revenues worth ₹60 crore. IIL is planning to make a further investment of ₹500 crore over the next few years into the plant at Karkapatla, Andhra Pradesh for further production activities.

IIL is now accelerating its activities in the human vaccine realm to gain further market share. A number of innovative vaccine initiatives have been started, which include the indigenously developed Salmonella vectored cervical cancer vaccine against Human Papilloma virus. The vaccine which will be delivered orally, will soon enter clinical trials.

IIL has collaborated with an organization from USA on a live attenuated virus vaccine for Chikungunya. Similarly, IIL is also developing a cell culture-based Japanese Encephalitis vaccine which is considered safer than the current culture system used. IIL also hopes to launch it's brand of indigenously developed pentavalent vaccine into the market soon.

Other neglected diseases that IIL is working on include certain infections caused in humans by parasites such as hook worm and porcine cysticercosis (Taenia solium), work for which is in early stages of development. IIL continues to follow an integrated model for animal welfare by providing animal vaccines along with other therapeutics, medicines, nutrition, veterinary health services and cattle feed. Hence, this year, IIL saw tremendous growth of over 100 percent in these allied services while earning over ₹30 crore. Both vaccines and therapeutics have jointly contributed towards this year's earnings where these therapeutics have shown a steady growth.
