Gandhi Automations bags two prestigious awards

13 March 2020 | News

The company has upgraded its systems by moving on to Artificial Intelligence

Gandhi Automations announced that the company has once again bagged two awards in a row at the prestigious events across 2 diverse industries.

The nominations, long drawn jury process, and showcase of their world class standard products have ensured the maintenance of the leadership position as well as the quality of company's innovative range of products in the Indian market and also validates the fact of their ever-increasing global presence.

With unshaken determination and passion to serve the customers, Gandhi Automation have turned every challenge and adversity into opportunity that helped them to achieve 70% market share in the industry in short span of time.

Automation is a powerful tool and comes in many shapes and forms. In the Logistic and Supply chain industries, automation is generally used to make gains upon existing processes by improving efficiency, speed, reliability, accuracy and (eventually) cost savings as it reduces the impact of a labor shortage; thereby keeping the labour cost down.

- Efficiency is critical to survival. Companies have to adapt rapidly, and if they're not adopting some form of robotics, they will not be able to compete.
- Using automation to protect the supply chain does more than help companies react quicker or reallocate internal resources to other tasks. It can also help reduce insurance costs.

At the moment the company is working along with some of the prominent architects and consultants on this issue. It is an absolute joint effort to educate the end users on the importance and the advantages of standardization.

As per the company statement, "We work as a consultant and we take into consideration the need of a customer & accordingly provide the best customized option. We provide customized solution as per specific need of a particular sector for e.g. pharmaceutical, chemical, automobile, food, cold storage etc. Each of these sectors has a unique material handling and warehousing requirement. Because of our expertise in this field we understand and explain to the client how he can make optimum use of the technology. The customer acknowledges this as the greatest value addition to him when he approaches Gandhi Automations for a particular product."

It also says, "We design, manufacture, supply, install and maintain highly sophisticated products. To fulfill our objective of providing products that are technologically advanced, energy efficient and safe we have a project engineering team that uses the latest design software combined with technologically advanced machinery to offer the customer a well-engineered product. All our products are based on the latest technology that conforms to very high standards of safety."

The company has upgraded its systems by moving on to Artificial Intelligence. The Products are now being designed with sophisticated systems which can be integrated with BMS – Building Management Systems. Thereby giving you an ease of operation from anywhere and any compatible device.
