

Everycom introduces non-contact infrared thermometer

19 August 2020 | News

The thermometer uses a touch free sensor to help minimise the risk of cross – contamination

New Delhi based startup EVERYCOM has launched IR37, non-contact infrared thermometer with a display temperature range of 89.6 °F to 109.4 °F (32°C to 43°C).

EVERYCOM incurred a total of Rupees Two Crore in designing and manufacturing the IR37. In fast - paced environments where speed and efficiency matter, this non-contact infrared thermometer is a valuable screening tool for many offices, clinics and homes.

This Made in India product comes with a infrared sensor that reads temperature from 3 – 15 cm distance from the centre of forehead, no skin contact required. It quickly obtains readings with minimal patient involvement to determine whether the patient presents with a normal or elevated temperature.

The thermometer uses a touch free sensor to help minimise the risk of cross – contamination. The device head does not require cleaning between each patient to help save time and cost as the thermometer yields a special antimicrobial coating.

The IR37 has various features to help enhance workflow like sleep mode, temperature memory recall button, fever alarm and different colour backlight for easy distinguishing.

EVERYCOM targets to manufacture 50,000 pieces of the infrared thermometer in a span of a month. The IR37 is priced at Rs. 2499 and is available for purchase for consumers on Amazon and for distributors and traders on everycom.in/html/home/index.html.

Soon the product will also be available on every medical shop. With an objective of being a leading brand in the Consumer

Electronic sector, the company also plans to manufacture Oximeter under it's Make in India initiative.
