

Virx.in to help doctors establish virtual clinics in India

01 September 2020 | News

The launch of ViRx – a business app created by a doctor for doctors is timely

SAN Innovative Systems Pvt. Ltd., a digital healthcare organization in Mumbai and Dr Vishakhadutt Patil, a doctor focused on designing digital solutions for the healthcare domain, have developed a cloud-based application – ViRx - specifically to help doctors establish their virtual clinics.

With the increasing use of the Smartphone in India, this ViRX mobile application can be used by doctors to get paid for their video consultations, issue digital prescriptions, keep video records of consultations as well as medical records, and also keep track of their payments. Doctors can set up their own consultation fees, which patients pay before consultation and the payment goes directly to the doctor's bank account.

There is a patient version too that is easy to use and helps automatically connect a patient to their doctor via the patient's mobile number. For easy accessibility, both apps are in English, Hindi and Marathi.

ViRx can also be used in a clinic where video consulting on a tablet device placed in the examination room can ensure safe distancing. ViRx can be used anywhere in India and is activated with a simple click. It is more than just a telemedicine solution.

It is a business application that includes clinical management, accounts and payment tracking, virtually unlimited video and audio records and customized patient management. It offers two modes – remote and clinic consulting mode.
