

RRI develops platform to detect effect of prolonged alcohol exposure on RBCs

06 March 2021 | News

The high-resolution platform can be tuned for a point-of-care screening of several other blood-related conditions in the future

Scientists have custom-made a platform to detect the effect of prolonged alcohol exposure on Red Blood Cells (RBCs) through high-resolution measurements of their size. The high-resolution platform that shows the reduction in size of RBCs on alcohol exposure can be tuned for a point-of-care screening of multiple conditions that alter the size and count of RBCs in blood.

Although it is known that alcohol affects RBCs, the exact physiological changes are very subtle and difficult to measure. In order to overcome this challenge, scientists from Bengaluru based Raman Research Institute (RRI) have developed custom-made electro-fluidic platform that can detect the change by measuring the cell size in enhanced resolution.

The device made in RRI relies on the resistive pulse sensing principle. The team first developed techniques for making tiny micron (1/1000th of a millimetre) sized holes or micro-pores at the tip of a glass capillary with careful fabrication, flame polishing, and image verification.

Cells passing through the pore created very tiny electrical pulses, which give direct and most sensitive information of cell count and volume. These results may also be used to explain the lack of oxygen-carrying capability of RBC under alcohol exposure leading to blurred vision, muscular in coordination, and altered mental states from alcohol abuse.

This research work, recently published in *ACS Sensors* journal of the *American Chemical Society*, was carried out by researchers Saurabh Kaushik, Manohara M., and K.D Murugan under the guidance of Dr. Soni and Dr. V. Sundaramurthy from National Centre for Biological Sciences (NCBS), Bangalore.

“Our lab had been working on building nanofluidic single-molecule detectors for the last few years. We found that some of the ideas used in the nanofluidic field may also be used in microfluidics in general and cell-biology in particular. We were pleasantly surprised with the reproducibility and resolution of our devices,” said Professor Gautam Soni.
