Apollo Cancer Centre, Datar Cancer Genetics launch blood test for breast cancer

22 June 2022 | News

The test can detect cancer before the first stage

Apollo Cancer Centres in association with Datar Cancer Genetics has launched a blood test that can detect breast cancers at early stages in asymptomatic individuals.

With an easy draw of a small quantity of blood, now, EasyCheck- Breast can help in the detection of breast cancer even before the first stage. The EasyCheck is available across India at all Apollo Cancer Centres.

Rajan Datar, Founder & Chairman, Datar Cancer Genetics, said, “Unfortunately, most cancers are detected at advanced stages which necessitate more intensive and expensive treatments which have a greater risk of debilitating side effects and treatment failures. EasyCheck- Breast is the culmination of years of collaborative international research and innovation and has been developed, tested, and validated on population-sized cohorts. A simple blood draw holds the promise of early cancer detection in asymptomatic individuals and opens the possibilities of successful treatments and improved survival.”
