Smart Ward with wireless patient monitoring technology

Amala Hospital, a leading multi-disciplinary chain of hospitals based in Kerala, has launched a new and innovative smart ward with wearable wireless technology. This smart ward, the first in Kerala, is equipped with advanced technology that provides continuous patient monitoring and aims to improve patient outcomes and reduce the risk of medical errors.

The hospital chain has partnered with Chennai based health-tech startup, LifeSigns to implement their iMS technology across cardiology and medicine departments at its hospital based in Thrissur, Kerala.

One of the key features of the smart ward is its wireless patient monitoring system, with early warning scores which allows for real-time monitoring of vital signs and other important health indicators. This technology eliminates the need for traditional wired monitoring systems, which can be cumbersome and uncomfortable for patients, and provides a more efficient and effective way to monitor patient health.

In addition to the wireless monitoring system, the smart ward is also equipped with monitors at nursing station, and patient information systems for the hospital, all of which work together to improve patient care and streamline the healthcare process.
