

Sciex announces launch of OS Software 3.3 to bring support for QTRAP system functionality

10 October 2023 | News

Addressing the need for a seamless user experience across product line

Sciex, a US-based leader in life science analytical technologies, has announced the launch of Sciex OS software 3.3. With this new release, Sciex OS now supports triple quadrupole linear ion trap (QTRAP) technology on the entire nominal mass spectrometry portfolio and provides access to the Dynamic Fill Time (DFT) feature, a tunable parameter designed to further optimise data obtained from QTRAP.

Sciex OS software 3.3 includes significant improvements in the batch and audit workspaces, allowing users to track project modifications with greater reliability. Users also have access to advanced customisable calculations and formulas within the software, eliminating the need to access third-party software to perform necessary calculations. These enhancements further streamline data processing and allow Sciex OS software users to access their data more efficiently and securely.

In addition, application programming interfaces (APIs) enable third-party applications to directly connect to Sciex OS software and automate critical aspects of user workflows, including instrument control and data processing, further boosting efficiency and productivity in the lab.
