MediElaj raises \$100K to bring AI-powered healthcare kiosks to underserved regions

01 June 2026 | News

Company is preparing to build its manufacturing capabilities for scalable production

India's healthcare technology landscape has taken a significant step forward with the official launch of MediElaj, an AI-powered healthcare app and smart diagnostic kiosk and mobile app platform developed by MedPredict.

The Faridabad-based startup has raised approximately \$100,000 from friends and family. In parallel, the founders have also bootstrapped and invested nearly \$500,000 into building the company's technology platform, AI healthcare ecosystem, kiosk infrastructure, and operational capabilities.

The company is building a connected healthcare ecosystem that utilises smart healthcare kiosk and mobile app to deliver at-home, AI-assisted health screenings and non-invasive health measurements, provide conversational assistance for healthcare issues, and offer access to digital health records.

The funds have enabled product development, kiosk prototyping, integrating healthcare devices and sensors, cloud architecture and software development, preparation for pilot deployments, and building a research and operational foundation for scalable growth.

MediElaj's kiosks combine AI-assisted health screening, non-invasive diagnostics, conversational healthcare guidance, and digital health records, bringing intelligent healthcare support directly to communities in smaller towns and rural regions, without requiring patients to travel to urban centres.

The company is now preparing to build its manufacturing capabilities for scalable production, establish nationwide deployment capacity, advance its AI technologies and cybersecurity infrastructure, and develop partnerships to form a healthcare ecosystem that reaches Tier 2, Tier 3, rural, and underserved markets.
