Tracky launches 16D, India's first 16-day continuous glucose monitoring system

12 September 2026 | News

Bringing glucose, lifestyle and vital health data together through AI-powered insights and a connected health ecosystem

Mumbai-based Drstore Healthcare Services, a connected healthcare and medical device ecosystem company, through its smart medical devices and technology brand Tracky, has launched India's first 16-day CGM system Tracky 16D, an integrated continuous glucose monitoring (CGM) system that provides up to 16 days of continuous glucose insights.

While most glucose monitoring systems provide insights for up to 14 days, Tracky 16D extends monitoring to 16 days, giving users a more comprehensive understanding of how their glucose levels respond to food, physical activity, medication, and everyday routines through an easy-to-wear wearable device.

Along with an improved mean absolute relative difference (MARD) of 8.58 per cent, the device features an integrated sensor and transmitter in a compact, lightweight design that is comfortable to wear and simple to apply. The platform brings together glucose data with nutrition, medication, exercise, sleep, blood pressure, and body composition, while features such as AI-powered health assistance, Bluetooth auto-sync, Nightscout integration, and the redesigned Tracky Health interface enable users to monitor, understand, and manage their health from a single connected experience.
