

# Bt cotton - The debate continues

12 November 2003 | News

It may be noted that BioSpectrum was not a part to any of the findings and does not have any stand on the issue. Bt MECH 12, Bt MECH 162 and Bt MECH 184 were the three transgenic varieties approved by the regulator, GEAC and the period of validity of approval is three years from April 2002-March 2005. As of now, it is premature to give a verdict on the performance of Bt cotton in any part of India. Its performance can be judged only at the end of the validity period, when there would be adequate and reliable data to do so.

## Gene Campaign report

The Gene Campaign report was compiled by Dr Suman Sahai and Shakeelur Rahman.

The study compared the performance of Bt to non-Bt cotton. It found that Bt cotton is no lagging behind the normal cotton in many respects. The study showed Bt cotton to be a than non-Bt cotton (100 to 120 days) but the plants showed less vigorous growth, with fe

wer barroles ampaign's wer barroles and shall be were marked by the company of survey

A major problem reported was the premature dropping of bolls in Bt cotton. A comparison of bolls and fibre showed that the number of bolls per plant was higher in the non-Bt cotton variety. Whereas the non-Bt variety averaged 95 bolls per plant, in the Bt variety the average was only 50 bolls.

The Bt cotton varieties compared by Gene Campaign were Bt 162 and Bt

Fibre length was also longer in the non-Bt varieties, which had better grade cotton. Non-Bt cotton was graded as A and B quality whereas Bt cotton was graded as B and C. Although both cotton types demonstrated a range of small to large bolls, more Bt cotton bolls were of a smaller size than the non-Bt cotton.

A significant finding of this study was the indication that Bt cotton variety does not offer protection against the protection against the period of expression of Bt endotoxin does not expression to some attack. This would mean that when the pest attacks the cotton, it is not expression to commercially cultivate permission to commercially cultivate.

The other explanation could be that the pink bollworm is not susceptible to Bt endotoxin of heart hard warming ledia that by probably developed resistance after being exposed to Bt toxin from the field trials that have been sampling to developed resistance after being exposed to Bt toxin from the field trials that have been sampling to be probably developed resistance after being exposed to Bt toxin from the field trials that have been sampling to be probably developed resistance after being exposed to Bt toxin from the field trials that have been sampling to be probably developed resistance after being exposed to Bt toxin from the field trials that have been sampling to be probably developed resistance after being exposed to Bt toxin from the field trials that have been sampling to be probably developed resistance after being exposed to Bt toxin from the field trials that have been sampling to be probably developed resistance after being exposed to Bt toxin from the field trials that have been sampling to be probably developed resistance.

#### **Economics of Bt cotton cultivation**

The study stated that the economics of cultivating Bt cotton was not in favour of farmers. The self-as the self-as

Variety averaged 95 boils per plant, in The Bt cotton varieties compared by Gene Campaign were Bt 162 and Bt 184 belonging to Mahyco-Monsanto and the non-Bt cotton varieties were the local hybrids and and B the cotton was graped as and B the cotton was graped to large bolls, Banny". This field study was done on the basis of data obtained from the first commercial Bt crop. The resulting the six estimates the cotton of the six estimates the handless because the cotton of the survey included a total in of he prake handless and handless and handless and handless and handless and the cotton on a portion of their landholding. These farmers were also growing non-Bt cotton simultaneously. Of the total of and handless and the cotton of the cotton simultaneously. Of the total of the cotton of

Agricultural University in Hyderabad

As against this outlay, savings on pesticide were meagre, averaging Rs 217 per acre. Thus the investment per acre is fluch before for the perfect of the perfect of the perfect of farmer had to invest on average, Rs 983 more per acre

And the average yield per acre of Bt cotton in all categories of landholdings—low, medium and high, was found to be poor when compared to its non-Bt counterpart. The result was that the net profit from Bt cotton was lower per acre compared to non-Bt cotton in all types of fields (low to high yielding).

Bt

The study pointed out that in fact, 60 percent of the farmers cultivating Bt cotton were not even able to recover their investment and incurred losses averaging R\$ 79 per acre. The performance of Bt cotton in the areas studied in Maharshtra and Andhra Pradesh was poor and the farmers have had to suffer losses. Not surprisingly, an overwhelming majority of the farming families surveyed (98 percent) said they were not interested in growing Bt cotton again.

Boll size | 6 - 8 gm | 3.5 - 5 gm

### Comparative income from Bt and non-Bt cotton

	Non-Bt	cotton	Bt cotton			
Farm Type	Farmers (%)	Income/acre (Rs)	Net Profit/ acre (Rs)	Farmers (%)		Net Profit/ acre (Rs)

Low Yielding	35	7394	2661	60	5637	-79*
Medium Yielding	58	12512	7779	35	9737	4021
High Yielding	7	20475	15742	5	15375	9659

## Findings of C Kameshwar Rao

Another survey on the performance of the first commercial standing Bt cotton crop was done by Dr C Kameshwar Rao, a botanist and executive secretary, Foundation of Biotechnology Awareness and Education last year.

His overall impression was that the Bt cotton variety, Boll Guard MECH 162, is performing well providing an effective control of the cotton bollworm. It should be mentioned that Dr. Rao had visited five fields and observed that one's visit of a few fields could not be the basis to generalize the situation in the entire state of Karnataka but nevertheless serves as a good indicator of the situation.

He observed that Bt cotton plants were more vigorous and early maturing at least by two weeks compared to the non-Bt refuge plameirlibedane feld. A farmer told him that the yield was about 40 percent more than his past experience with the non-Bt cotton harvest and was full of praise for Bt cotton. Th farmer had applied only two sprays of insecticides for the sucking insects and one spray for the bollworm and hence saved a lot of money in terms of pesticide costs, which would have been incurred otherwise. He planned to pick cotton till March 2003, which was not possible with non-Bt cotton, all these years. cotton fields, near Ranibennur

(central Karnataka), along with a

Presented to the sprays for sucking insects and five sprays for sucking insects and five sprays for ignitivering and telligible to was heavy infestation by bollworm. At this rate the farmers would be spraying insecticides about a dozientimes more by the and of the cropping season. Due to this the resulting loss of yield would certainly be more than 20 persentandanave yng hee40 persent.

Monsanto to market Boll Guard, the

<del>թեւ օնչչութչչչէի գե the ig is թեւօրցչցով</del> regarding a fall in the yield of Bt cotton. Boll Guard was never projected for improved wielded that ever big the cortie of the grammers get is due to prevention of loss rather than improved performance of Bt-cotton in terms of the leave the claim that since even Boll Guard needs insecticide spray, it is a deceitful introduction. Boll Guarabis refractives on two gains the bollworm, which is the principal pest responsible for the loss of the end product, which is the control of the five kinds in section damage the leaves and this would certainly reduce the yield to an extent but they are not as the description of the sprayed against product directly. Insecticides need to be sprayed against Person of the half of the cotton is very significant.

crop was about 80 days old. The varieties of Bt and non-Bt cotton in the neighbouring fields were not the same. One non-Bt was Indo-American Hybrid seed and the other was Brahma, while the Bt cotton was MECH 162.
