### NCCS Scholar receives BD-TCS Award

BD Biosciences, India in collaboration with The Cytometry Society - India (TCS) instituted an award for "Excellence in Flow Cytometry" in 2009 to recognize the creative use of flow cytometry as a tool for addressing problems in the fields of clinical or basic research. The BD-TCS Award constitutes a prize of Rupees One Hundred Thousand and a citation. Eligible investigators submit their published papers, which are screened by a national committee constituted by the President, TCS and the shortlisted papers are evaluated by an international jury consisting of eminent flow cytometry experts. The winner is felicitated at the Annual Meeting of TCS. This year 5th BD-TCS Award Function was held at Bhubaneswar, State of Odisha in India which also hosted the 1st BD-TCS Award function in 2009.

The recipient of the 5th BD-TCS Award (2013) is Reecha Shah, a research scholar from the lab of Dr Padma Shastry at National Centre for Cell Sciences, Pune. She won the Award for her paper elucidating molecular mechanism of sodium valproate (VPA) potentiating the cytotoxic effects of anti-cancer drugs. The study provides new information on the possible utility of VPA, a commonly used anti-epileptic drug, in combination chemotherapy.

On receiving the coveted BD-TCS Award, Reecha Shah said, "It is a great feeling to receive an award from such a prestigious platform. It is indeed very encouraging to see that our work is getting appreciated by the community and paves way for many more aspirants to participate each year. I hope this award takes me to greater heights as I plan to move to San Jose soon."

YS Prabhakar - Business Director, BD Biosciences in India, said "BD Biosciences is proud of its association with TCS. We have teamed with TCS to reward meritorious scientific research in India. We believe this will go a long way in motivating life science research specifically by using Flow cytometry. Flow technology can be gainfully employed much more (than present level) for research or clinical purposes. We are confident that through interactions with progressive societies of scientists like TCS."

Flow Cytometry has been recognized as one of the important technologies that transformed the face of modern life science and biotechnology research in India. Over the past few years, the technology has witnessed continuous improvement in multicolor analysis, high speed cell sorting, new fluorochromes, innovative reagent portfolios, and new emerging applications in health care research. Flow Cytometry makes the scanning of millions of cells in minimum time and cells of interest can be further tagged with suitable add-ons to study their various characteristics. Flow Cytometry is a count and measure of the physical and chemical characteristics of numerous biological particles such as cells, cell subsets, DNA, surface antigens and bacteria.
