

In November 2015, Arterys and GE Healthcare entered into a partnership to include the Arterys system in new GE Healthcare MRI machines. Financial terms of the agreement were not disclosed.

"We are extremely pleased to announce our partnership with GE Healthcare in conjunction with the launch of our first cardiac care solution, the first self-learning system of its kind to visualize and quantify blood flow leveraging a standard MRI machine," said Dr Fabien Beckers, founder and CEO of Arterys. "This pivotal milestone for the company is directly in line with our vision to transform medical imaging by bringing automatic quantitative data and deep learning to healthcare applications through a GPU smart cloud platform that can be applied to many areas of medical imaging including neurology and oncology."

In addition to the launch of the Arterys System, the company completed a \$7 million Series A financing led by Emergent Medical Partners, including participation from Norwich Ventures, AME Cloud Ventures, Morado Ventures and Asset Management Ventures.
