Pathkind Diagnostics expands autoimmunity testing with innovative Alegria Monotest technology

18 October 2024 | News

Sebiaâ??s Alegria system uses a monostrip format that simplifies the testing process

Autoimmune diseases, which affect millions worldwide, often require complex diagnostic processes that can delay treatment and adversely affect patient outcomes. The partnership between Gurugram-based Pathkind Diagnostics and Sebia seeks to streamline this process, providing healthcare professionals with an efficient, user-friendly diagnostic tool that enhances patient care.

By integrating this cutting-edge technology into Pathkind's network, Pathkind aims to make advanced autoimmune disease diagnostics more accessible and efficient.

Sebia's Alegria system uses a monostrip format that simplifies the testing process while maintaining high accuracy and precision. This streamlined approach not only reduces the burden on laboratory resources but also empowers healthcare professionals to provide timely interventions.

Alegria is a cutting-edge sample-to-result solution for autoimmunity that revolutionises diagnostics for Rheumatology, Thrombosis, ANCA & Vasculitis, Gastroenterology, Thyroid, and Stool testing. Each Alegria Monotest strip includes the complete set of reagents that are needed to perform the analysis for one individual patient result. Each test result is validated with its own integrated control for the highest reliability and quality in the lab.

Post-COVID, India has seen a significant rise in autoimmune disorders, affecting millions of lives and creating an urgent need for advanced diagnostic solutions. These complex conditions often go undiagnosed or misdiagnosed, leading to delayed treatment and worsening patient outcomes. The introduction of Alegria Monotest technology aims to address this growing health crisis by offering precise, rapid, and reliable autoimmune testing, enabling earlier diagnosis and better patient care across the country.
