OMRON Healthcare begins full-scale production at first factory in India

31 October 2026 | News

Chennai Factory strengthens domestic blood pressure monitor supply and supports preventive cardiovascular care in India

OMRON Healthcare, a global leader in clinically proven medical devices for home health monitoring and treatment, has announced the commencement of full-scale blood pressure monitor production at the OMRON Group's first factory in India, located near Chennai, Tamil Nadu.

Operated by OMRON HEALTHCARE MANUFACTURING INDIA Pvt. Ltd., the facility represents a significant step in the company's expansion of local manufacturing in India. To mark the launch of full-scale production, the factory's manufacturing operations were opened to domestic and international media and other stakeholders for the first time.

Located at ORIGINS by Mahindra, the approximately 24,000-square-meter site has five production lines manufacturing blood pressure monitors for the Indian market. Drawing on production technologies and quality-control expertise developed at OMRON Healthcare's Matsusaka factory in Japan and its sister facility in Vietnam, the factory manufactures the HEM-7090, HEM-7181, and HEM-7183T series to the same standards of measurement accuracy and quality as the company's medical devices supplied to international markets.

Designed to meet the needs and price expectations of Indian consumers, these range from straightforward models for first-time users to high-end devices with features including Trend Indicator, which alerts users to increases in blood pressure readings, and Bluetooth connectivity with the OMRON Connect health management app. The factory also supports the government's Make in India initiative through local component sourcing, workforce development, and employment creation.

Moving forward, the company aims to increase the Chennai factory's production capacity tenfold by 2028, in order to ensure a stable supply of blood pressure monitors for the Indian market, develop Chennai as a supply base for international markets, and introduce nebulizer production for the treatment of respiratory conditions such as asthma, strengthening the availability of home healthcare devices in India and beyond.
